

Best Management Practices for SLUG-FEST In Soybeans

KENTUCKY ONLY

KY 24© SLN Registration for Soybeans

Follow all directions, restrictions, and precautions on the label

For Best Results

- Apply 23-69 fl. oz. per acre. Good spray coverage is essential.
- Apply when dew is present, and no rain is expected for 12-24 hours after application.
- Apply from dusk to dawn when there is little-to-no direct sunlight; fog is best. Slugs are nocturnal and do most of their feeding at night, they shy away from bright light.
- Apply when there is little to no wind.
- Make applications by ground sprayer equipment. Direct spray to remains of cover crop and/or bare soil.
- The air temperature should be between 40-70 degrees.
