

# Best Management Practices for SLUG-FEST

MADE IN THE WILLAMETTE VALLEY

Follow all directions, restrictions, and precautions on the label

## For Best Results

- Apply 23 fl. oz. per acre. Good spray coverage is essential.
- Apply when dew is present, and no rain is expected for 12-24 hours after application.
- Apply from late afternoon through early morning when there is little to no direct sunlight; fog is best. Slugs are nocturnal and do most of their feeding at night, they shy away from bright light.
- Apply when there is little to no wind.
- Apply as a perimeter treatment at planting and for subsequent applications by broadcast, directing the product to the soil.
- The air temperature should be between 40-70 degrees.
